

Early Journal Content on JSTOR, Free to Anyone in the World

This article is one of nearly 500,000 scholarly works digitized and made freely available to everyone in the world by JSTOR.

Known as the Early Journal Content, this set of works include research articles, news, letters, and other writings published in more than 200 of the oldest leading academic journals. The works date from the mid-seventeenth to the early twentieth centuries.

We encourage people to read and share the Early Journal Content openly and to tell others that this resource exists. People may post this content online or redistribute in any way for non-commercial purposes.

JSTOR is a digital library of academic journals, books, and primary source objects. JSTOR helps people discover, use, and build upon a wide range of content through a powerful research and teaching platform, and preserves this content for future generations. JSTOR is part of ITHAKA, a not-for-profit organization that also includes Ithaka S+R and Portico. For more information about JSTOR, please contact support@jstor.org.

direction by the recognized giants of science. It is axiomatic that a clear conception of what a problem really *is* is a prerequisite to its successful solution. I ask to be permitted to offer the following enunciation:

Neither a quest for an "explanation" of the cause or nature of gravity, on the one hand, nor a mere non-logical acceptance of the fact as a matter of belief or blind faith, on the other, but *the evolutionary development in the minds of men of a scientific satisfaction not only with not knowing but with not ever being able to find out* any rational and consistent theory or explanation for the attraction influence among all portions of matter which is called *gravity* and which is the essential, universal and unalterable attribute of all material things whatsoever.

Obviously such a conception involves rather more of philosophy and psychology than of so-called physical science.

JOHN MILLIS

A SIMPLE METHOD FOR FILLING AN OSMOMETER

IN setting up the type of apparatus ordinarily used in elementary classes to demonstrate osmosis, the thistle-tube is filled with molasses or strong sugar solution. If this is done before the membrane is tied on, the apparatus becomes sticky and the difficulty increased. If, on the other hand, the tube is filled after the membrane is secure, it is very difficult to force the liquid down the narrow stem.

For the last two years I have found the following to be a simple and effective method for filling the tube. Take a perfectly dry thistle-tube, fill it with dry granulated sugar to the flare at the top, and then tie on the wet membrane with a waxed thread. When the tube is inverted the sugar will fill the bulb. With the solution of the lowest layer of sugar in the water of the membrane, the osmotic action is started and the liquid rises in the tube. First observations may be taken when a saturated solution has been formed and no dry sugar remains.

QUOTATIONS

THE PROPOSED UNION OF SCIENTIFIC WORKERS

WE continue to receive replies to our notice regarding the emoluments of scientific workers; and they emphasize the opinions which have already been expressed in the leading article of the April number of this *Quarterly*. For example, one worker, a London graduate with first-class honors, who has published original research work and is now a demonstrator working two or three days a week, and who also gives two courses of post-graduate lectures with demonstrations, and does other work, receives the generous salary of fifty pounds per annum—much less than most unskilled laborers will work for. We hear that in one British university, out of two hundred members of the junior staff in all departments (that is all members of the teaching staff who are not full professors), not more than six receive a stipend greater than two hundred and fifty pounds a year. There appears also to be some fear amongst junior staff workers that if they divulge particulars of their salaries they will lose their posts; and in one case we are informed that some highly specialized workers seem even to have lost the ambition ever to earn a reasonable wage. In addition to the poorness of the pay, complaints are made regarding the entire absence of any provision for adequate pension and also regarding the state of serfdom in which men of science are kept under boards and committees composed of persons who frequently have no qualifications for the exercise of such authority. The whole picture is a melancholy not to say a disgraceful one for so wealthy a country, which also imagines that it possesses the hegemony of the world. On the other hand, much sympathy is expressed on behalf of any endeavors that may be made to remedy these evils, and men of science appear to be awakening to the fact that they should attempt some combined effort in this direction. We note especially an excellent article on the "Income and Prospects of the Mathematical Specialist," by Professor G. H. Bryan, F.R.S., in the April number of the *Cornhill Magazine*, and an admirable lecture on the "Place of Science in Modern
